

ABSTRACT OF THE INVENTION

A method and system are provided for efficient development of software application programs with user interfaces. Customarily, several specialists, including designers and developers, cooperate during the development stage of an application

5 program. The invention teaches a strategy for making resource files external to the other compiled executable files in an application such that the information from the resource file may be obtained at runtime as needed without the need for compilation. Furthermore, the external resource file may be edited at runtime to allow designers to modify the look and feel for an application's interface without having to depend on developers to

10 implement changes in the interface. This is achieved by providing resources in a markup language and routines that locate and parse the markup language text on the fly as an application executes. Compartmentalization of the effort in developing and porting an application is facilitated for protection of source code and better management of designers and developers working on different aspects of a software application due to the

15 externalization of the resource files needed primarily by the designers.
